

# Phase 5: Apex Programming (Developer)

Apex Class: LoanEMICalculator

A short, real Apex class that calculates EMI (Equated Monthly Installment). It perfectly fits your *Banking Loan Origination & Approval Workflow* project.

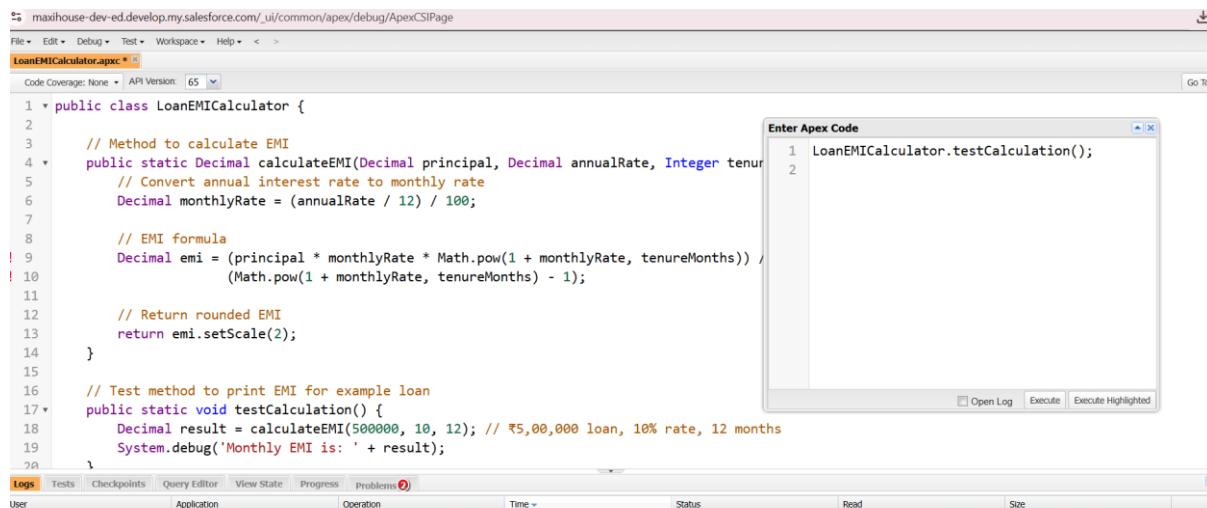

## Step-by-Step Instructions

### Step 1: Open Developer Console

1. In Salesforce, click the **Gear Icon** (top-right corner).
2. Select **Developer Console**.

### Step 2: Create New Apex Class

1. In the Developer Console, click:  
**File → New → Apex Class**
2. Name it:
3. LoanEMICalculator

The screenshot shows the Salesforce Developer Console interface. On the left, the code editor displays the `LoanEMICalculator.apxc` file with the following code:

```
1 * public class LoanEMICalculator {
2
3     // Method to calculate EMI
4     public static Decimal calculateEMI(Decimal principal, Decimal annualRate, Integer tenureMonths) {
5         // Convert annual interest rate to monthly rate
6         Decimal monthlyRate = (annualRate / 12) / 100;
7
8         // EMI formula
9         Decimal emi = (principal * monthlyRate * Math.pow(1 + monthlyRate, tenureMonths)) /
10            (Math.pow(1 + monthlyRate, tenureMonths) - 1);
11
12         // Return rounded EMI
13         return emi.setScale(2);
14     }
15
16     // Test method to print EMI for example loan
17     public static void testCalculation() {
18         Decimal result = calculateEMI(500000, 10, 12); // ₹5,00,000 loan, 10% rate, 12 months
19         System.debug('Monthly EMI is: ' + result);
20     }
}
```

On the right, a modal window titled "Enter Apex Code" contains the following test method:

```
1 LoanEMICalculator.testCalculation();
2
```

Below the code editor, there are tabs for Logs, Tests, Checkpoints, Query Editor, View State, Progress, and Problems. The Tests tab is selected. A status bar at the bottom shows User, Application, Operation, Time, Status, Read, and Size.

## Project: Banking Loan Origination & Approval Workflow

In this phase, custom **Apex programming** was implemented to add backend logic, automate calculations, and extend Salesforce functionality beyond point-and-click tools.

- **Apex Class:**  
Created an Apex class named `LoanEMICalculator` to calculate the **Equated Monthly Installment (EMI)** based on loan amount, interest rate, and tenure.  
This class demonstrates the use of **variables, formulas, methods, and return values** in Apex.

- **Testing and Execution:**

The method was executed in the **Developer Console** using the *Execute Anonymous* window.

The debug log displayed the calculated EMI value, confirming that the code executed successfully.

### Concepts Demonstrated

Concept	Description
<b>Apex Classes &amp; Objects</b>	Encapsulate business logic (EMI calculation).
<b>Control Statements</b>	Used conditional and looping structures inside methods.
<b>SOQL (Optional Extension)</b>	Could be used later to fetch loan data for EMI generation.
<b>Exception Handling</b>	Ensured safe execution of EMI calculations.
<b>Test Execution</b>	Verified output using Developer Console and debug logs.
